Dairy-Herd-Improvement-Association Letter

ARS-52-37
(Vol. 32, No. 6)

June 1956

CHANGE IN DHIA TESTING RULES

The American Dairy Science Association at its annual meeting in Storrs, Connecticut, June 18-21, approved the following changes in rules governing DHIA record keeping:

Rule 3. IDENTIFICATION OF ANIMALS - "Every dairy animal in DHIA herds must be positively identified and recorded on registry page DHIA-16 of the owner's herd-record book within 60 days after entering the herd by birth or purchase. Acceptable identification shall be (1) registration numbers, or (2) old or new series DHIA or ABA eartag numbers, or (3) new uniform disease eradication and control eartag numbers. (State code, 3-letter prefix, 4 digits). Tattoo numbers are acceptable on purebred animals as temporary identification until the animals enter the milking herd.

The above rule was revised on the basis of the following recommendation made by the ADSA Records Committee: "Present plans indicate that within two years the compilation of all DHIA data and proved sire records in the Branch will be done on data processing tape equipment. As only uniform controlled eartag numbers can be used for identification of lactation data in the new processing equipment, the committee recommends that all States be advised to use exclusively the new uniform numbered eartags for identifying all DHIA animals."

- Rule 6. COWS TO BE TESTED - Omit from the last line the following words: "and all monthly and yearly publicity shall be withheld."
- Rule 17. LOST SAMPLES - Add the following: "If records are being calculated by mechanical methods (punch cards or tape) the following rule shall apply: When a sample is lost, the previous month's butterfat test shall be used. When milk weights are not obtained the pounds of milk for the current test day shall be estimated from the previous month's record by use of the nurse cow table found on page 19 in the May, 1956, DHIA Supervisor's Manual. In either case the record shall be coded as 'estimated'."
- Rule 24. COWS NURSING CALVES - "Temporary nurse cows - cows nursing calves on the testing day are considered for the time being as dry cows. Feed records are taken as usual and recorded in the herd-record book. No milk samples are taken. Milk weights and tests obtained on the first testing day after calves have been removed or the last testing day before calves are put on cows are used in computing production for the testing periods in which calves were nursed using nurse cow table, page 19, of the DHIA Supervisor's Manual."
- "Permanent Nurse Cows - A cow that is to be used as a nurse cow throughout the entire lactation period may, at the request of the herd owner, be removed from test from the date of freshening until the following date of freshening, provided, that she has at least one complete lactation record."

DHIA PROVED-SIRE RECORDS TABULATED IN MAY 1956

Following is a list of 324 sires whose records were tabulated or retabulated by the Dairy Husbandry Research Branch in May 1956. Production records used in proving DHIA sires consist of 305-day lactation records standardized to a mature equivalent twice-a-day milking basis.

An asterisk at the end of a sire's registration number indicates a retabulated record. The asterisk may be followed by any number from 1 through 15 (i. e., *12) to indicate in which of the 15 printed lists his previous record appeared. Or the asterisk may be followed by the month and year (i. e., *May 51) of the DHIA letter in which his previous record appeared. Two asterisks following the sire's registration number, or following reference to a previous listing, indicate that the proved-sire tabulation or retabulation was requested by one of the States.

In case records from more than one herd were used, the reference is to the herd from which production records for the largest number of the sire's youngest daughters were reported. If the sire has been used in an artificial-breeding association, the name of the association is given.

Proved-sire records consisting of fewer than 10 comparisons are indicated as "preliminary proofs" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire records.

Proved-sire records consisting of fewer than 25 comparisons with daughters resulting from artificial breeding are indicated as "preliminary AB proofs" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire records.

To make the most intelligent selection of a sire, the dairyman should use these proved-sire records to single out the most promising sire and then make every effort to supplement these data with additional information gathered from the herds in which the dams and daughters made their records. Particular attention should be given to the feeding practices and environmental conditions under which the records were made, in order to be assured that the records of the daughters were not made under more favorable conditions than those of the dams or vice versa. It is especially important to determine that there has been no selection of daughters in making the comparison.
